Department Of CSE, Rangamati Science And Technology University

Introduction

Life expectancy is a critical indicator of a nation's overall health, socio-economic progress, and well-being. Understanding and predicting life expectancy is essential, as it reflects the combined impact of various health, environmental, and socio-economic factors on the quality of life across populations. Accurate predictions can guide governments and organizations to design effective public health interventions and policies to tackle disparities in health outcomes.

This project explores the use of machine learning to predict life expectancy by analyzing key predictors such as healthcare access, income levels, disease prevalence, and lifestyle habits. In today's data-driven world, machine learning offers a promising approach to identifying patterns and generating insights that traditional methods might overlook. By analyzing these patterns, the model developed in this project can aid in determining how factors like alcohol consumption, adult mortality, and infant deaths impact life expectancy globally.

Such predictive models are particularly crucial in addressing issues faced by developing countries, where resources are limited and targeted strategies are necessary. This study's findings aim to help policymakers and stakeholders implement data-driven solutions to improve life expectancy, making it an invaluable tool in improving public health worldwide.

Objective

The main objectives of this project are to develop a comprehensive approach to predicting life expectancy by examining key factors and optimizing model performance. This includes utilizing machine learning techniques to uncover significant predictors and evaluate the effectiveness of various models. The following objectives outline the process undertaken in this project:

- Analyze key factors influencing life expectancy globally.
- Preprocess and engineer features for better model performance.
- Develop and compare machine learning models to predict life expectancy.
- Evaluate model performance using metrics like R^2 and residual analysis.
- Identify influential features and provide actionable insights.

This project aims to predict life expectancy by analyzing key socio-economic and health-related factors using machine learning techniques. The goal is to identify significant predictors and build a robust model to assist policymakers in addressing disparities in global health outcomes.

Motivation

Life expectancy is a vital indicator of overall well-being, reflecting the effects of socioeconomic conditions, healthcare access, and lifestyle factors. By leveraging machine learning, this project seeks to understand the impact of these factors on life expectancy. The insights generated can guide effective healthcare planning, resource allocation, and policy decisions, particularly in developing countries facing health disparities.

Methodology

Our project follows a systematic approach to predict life expectancy using machine learning. The methodology comprises several key steps, starting from data collection to model evaluation. The following diagram illustrates the methodology in detail.

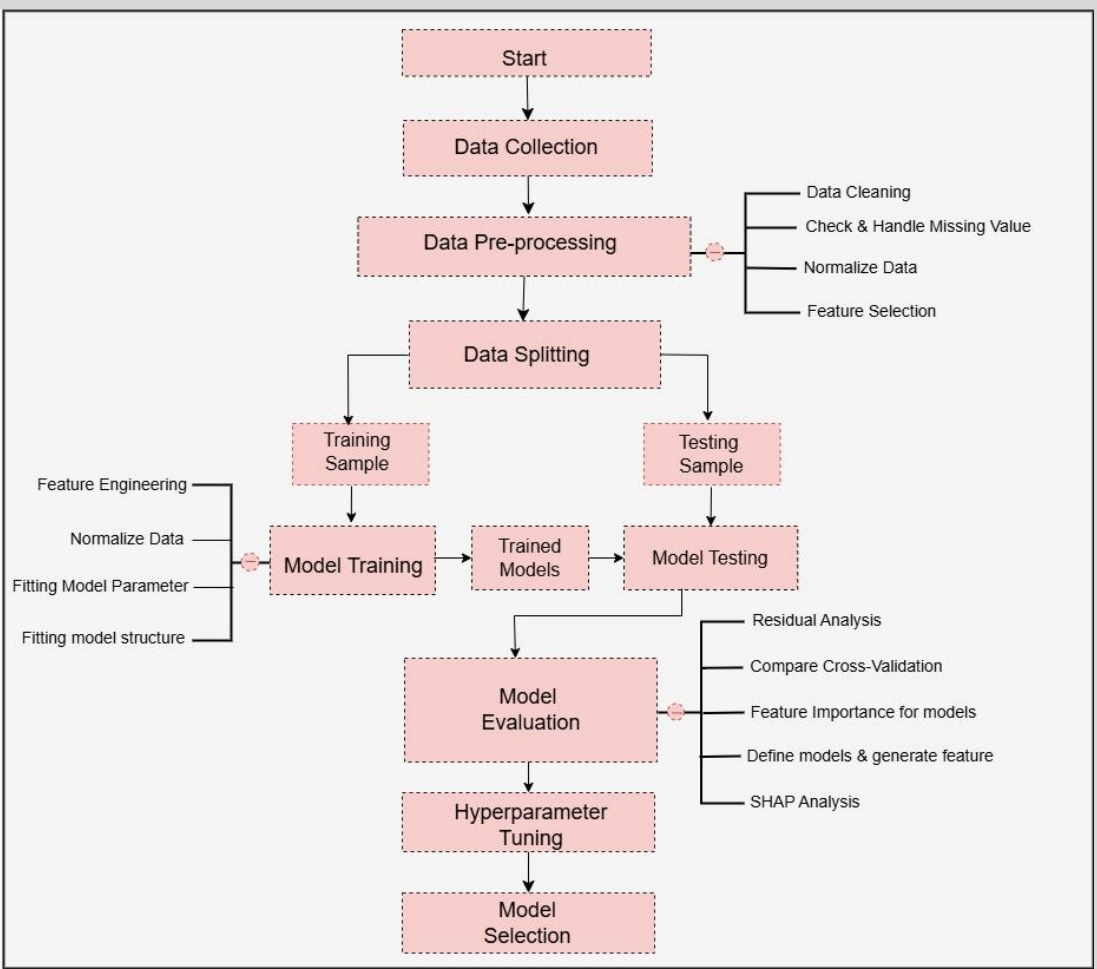

Figure 1: Methodology for Life Expectancy Prediction

The following sections delve into each step in greater detail, supported by visualizations and results.

Data Collection

Dataset sourced from [https://www.kaggle.com/kumarajarshi/life-expectancy-who]. The dataset contains features related to socioeconomic factors, health indicators, and life expectancy.

	country	year	life expectancy	adult mortality	infant mortality	under-five mortality	hiv_aids	income_composition_of_resources	adult_mortality	under-five_mortality	bmi
